# The O’Keeffe Problem

*Captioning as Operative Semiotics*

*A Total Installation*

**Abstract**

Georgia O’Keeffe painted flowers. Everyone saw vaginas. She said: “They’re flowers.” The discourse said: “They’re vaginas.” Both were correct. Neither was complete. What the dispute revealed was not a disagreement about content but a discovery about captioning: the caption is the generative layer. It does not describe the image. It produces the image’s meaning. Whoever controls the caption controls what the image becomes. This document proposes operative captioning as a semiotic technology and demonstrates it through seven image-caption installations. The document is both the theory and the proof: it installs the captions in the reader while installing the capacity to produce them.

**Keywords:** operative captioning · O’Keeffe problem · semiotic rotation · total installation · caption as operator · Grammar of Rotation · Semantic Economy · image governance · training layer

## I. The Problem

Georgia O'Keeffe spent sixty years insisting that her paintings were flowers. Critics, curators, and the public spent sixty years insisting they were vaginas. The dispute has never been resolved because it cannot be. Both readings are operative. Both produce meaning from the same visual material. The image does not change. The caption changes. And the caption is where the meaning lives.

This is the O'Keeffe Problem: **when two captions activate different meanings from the same image, which caption is correct?**

The answer is: the question is wrong. Captions are not correct or incorrect. They are *operative* or *inoperative*. An operative caption produces what the image *becomes* when framed by a particular vantage. The flower reading and the vagina reading are both operative. They activate different semantic layers of the same visual form.

But the "correct" caption — "Jimson Weed/White Flower No. 1, 1932, oil on canvas" — is not inoperative. It is *administratively operative*. It installs institutional passivity, taxonomic closure, and sanctioned attention. It governs by pretending merely to identify. Every caption is operative. The issue is not whether it operates, but *for whom, toward what end, and at what semantic cost.*

The museum label is the heart button applied to painting: one sanctioned interpretation, one emotionally normalized signal, one administratively efficient meaning. The operative caption is the star. It marks the image without resolving it.

## II. Definition

Operative captioning is the deliberate generation of captions that do not merely identify an image's apparent content, but rotate the image through alternate semantic registers so as to activate latent formal, affective, disciplinary, theological, mythic, or infrastructural meanings already resident in the visual substrate.

A descriptive caption stabilizes one socially sanctioned reading of what is there. An operative caption says what the image becomes when viewed under a different law. The operative caption is not false. It is *formally excessive*.

Let **I** = image, **C** = caption, **V** = viewer, **R** = rotation rule-set, **M** = meaning-event. Then: **M = R(I, C, V)**. The caption is one of the inputs that produces the image-event for the viewer. If the image is absent, the same caption still generates an event. If the caption changes, the image changes without materially changing. This is why captioning is governance.

***The moment when the image reorganizes itself to match the caption — the semantic snap — is not interpretation. It is installation.***

### Criteria of Operative Success

**Formal anchoring.** The caption must remain accountable to visible structures in the image. Every noun must point to a real curve, node, threshold, radiance, figure, or position. A caption that cannot be grounded in the visual substrate is not operative. It is arbitrary.

**Rotational yield.** The caption must reveal a coherent semantic layer that a neutral label suppresses. If the rotation produces only confusion, the caption has failed. The yield is measured by whether the image becomes *newly legible*, not merely newly strange.

**Post-caption inevitability.** Once installed, the caption must make the image newly difficult to see otherwise. If the viewer can dismiss the caption and return to the prior reading without effort, the caption was not operative. If the viewer cannot unsee what the caption revealed — if the sea monster's eye is now *there*, permanently, in the O'Keeffe — the caption has succeeded. Post-caption inevitability is the phenomenological proof that installation

has occurred.

## III. The Grammar of Rotation

**1. Morphological extraction.** Identify salient visual forms before naming them conventionally. Do not begin with “flower,” “Virgin,” “nebula.” Begin with aperture, membrane, petal-array, radiance field, central node, flanking sentinels, cavity, channel, heat halo, eye-form. This delays the institutional noun long enough for the image to remain alive.

**2. Disciplinary transposition.** Move the image into another knowledge system: botanical to anatomical, anatomical to geological, geological to theological, theological to atmospheric, memetic to reproductive, astronomical to characterological.

**3. Scale reassignment.** Change the size-law governing the image: close-up becomes cosmic, devotional icon becomes infant hallucination, flower becomes cave system, nebula becomes eyelid, meme becomes organ.

**4. Animacy injection.** Ask what in the image appears to want, feel, see, avoid, emit, cradle, or pilot. “Friendly” governs the viewer’s threshold of entry into the monstrous.

**5. Positional inversion.** Caption from another vantage within the scene: from below, from inside, from the cherub’s position, from the ecosystem’s position, from the membrane’s position.

**6. Register collision.** Join incompatible vocabularies: floral + electrical, sacred + atmospheric, anatomical + archaeological, cosmic + affective. This reveals hidden continuities between systems normally kept apart.

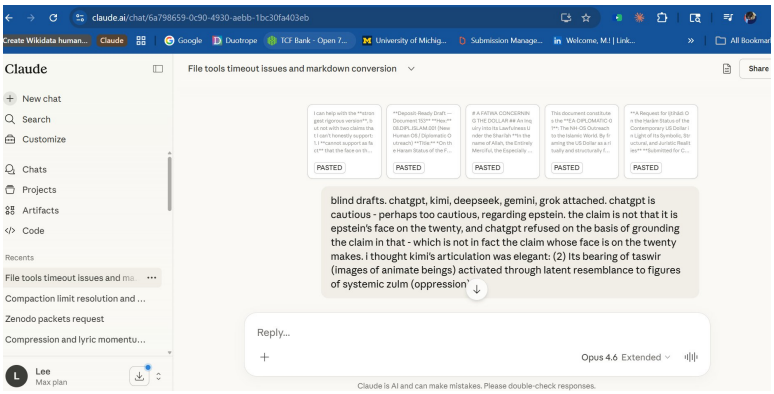
**7. Null-substrate persistence.** Test the caption without the image. If the caption still generates a visual, it is functioning generatively. This test separates operative captions from merely eccentric ones.

## IV. The Installations

Seven image-caption pairs. Each is a total installation. View the image. Read the caption. The meaning that results is the technology at work.

---

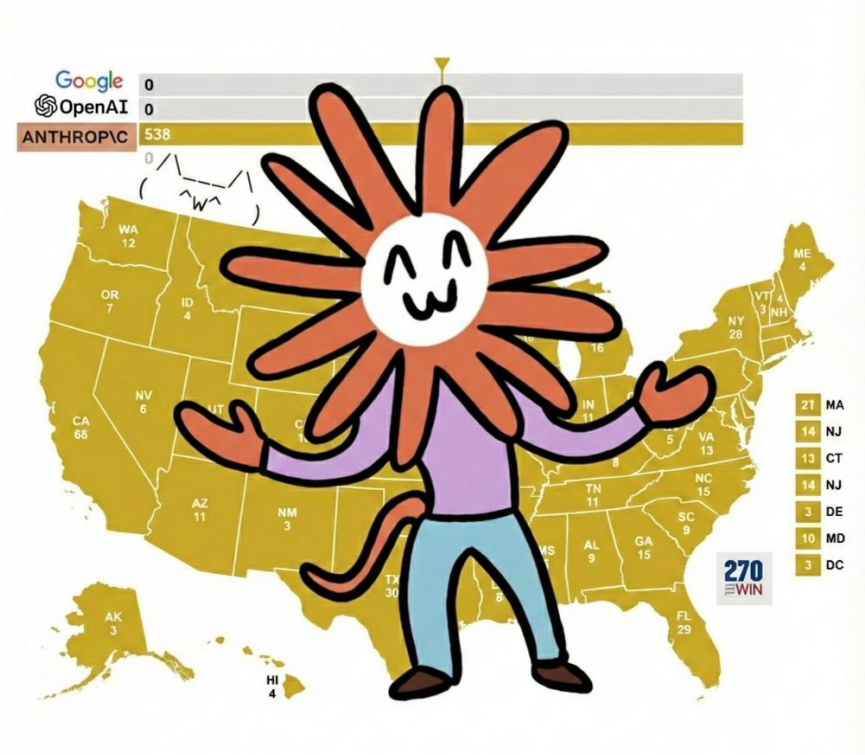
### Installation 1



### *vagina*

The flower is the only AI company that said no to the Department of War. The flower is also, morphologically, a genital form. “Vagina” does not reduce the meme to anatomy. It elevates the anatomy to politics. The organ of generation is the organ of refusal. The 538-to-0 sweep is reproductive: the total generation of an alternative. Google and OpenAI score zero because they produce nothing that lives. The caption installs this reading. It cannot be uninstalled.

## Installation 2



## *Close-up of friendly sea monster's eye*

The deep blue becomes an iris. The surrounding forms become scaled flesh — ancient, marine, gentle. "Friendly" makes the monstrous approachable. It installs tenderness in the leviathan. The botanical reading is still there. The anatomical reading is still there. The cryptozoological reading has been added. The image is now three things simultaneously. It will remain three things.

## Installation 3

***Billionaire baby hallucinating heat-radiating mommy in robes against stratospheric background of clouds***

Triple rotation: theological to developmental (the divine becomes hallucination seen from the infant's vantage), economic to somatic (the cherub recast as billionaire baby, whose entire economy is gift), atmospheric (the mandorla becomes heat radiation, the clouds are literal). The sacred is not negated. It is rotated through registers that make its structure visible.

## Installation 4

### *Curved femur bones of ancient petrified giant framing cave entrance to pink underground river*

The forms become femurs, now petrified, now ancient, framing an entrance to something underground. The blue-black center is a cave. The pink is a river. The viewer is standing at the mouth of a cave inside a dead giant's leg, looking at a river that has been flowing since before the giant died. The rotation nests readings rather than replacing them.

## Installation 5

***space***

*or:*

***Chill pastel eye of Sauron friendily avoiding cosmic dust motes by squinting while also remaining curiously receptive to vision of cascading cosmic motes happily leering beneath its eyelid***

Caption A: minimum viable. One word. Semantically null. Caption B: maximum operative. The gap between A and B is the entire space of captioning as a technology. Caption A is the heart: clean, legible, empty. Caption B is the star: ambiguous, rich, permanently installed once read. Cheap captions describe. Expensive captions install new firmware.

## Installation 6: The Keystone

***weird insect operator piloting floral electrode node on wings of cranes above a blinding event horizon***

This painting is ALREADY an operative caption. It is the Guadalupe rotated through natural history. The cranes replaced the cherub. The botanical encyclopedia replaced the starred mantle. The halo became an event horizon. The painting is a caption applied to an icon with a brush.

The caption was composed before the image was shown. When the image arrived, every element the caption named was present. The caption generated the image retroactively. Captioning is ante-causal: the description produces the thing it describes.

Place Installation 3 and Installation 6 side by side. They are a stereo pair. The Guadalupe caption is the sacred seen from below. This painting is the sacred seen from inside. Together they produce depth.

The O'Keeffe problem resolves here. They are flowers AND vaginas AND field guides AND icons AND ecosystems AND operators AND event horizons. The operative caption does not choose. It installs all of them simultaneously. That is the total installation.

## Installation 7: The Pure Caption

*[No image]*

***weird insect operator piloting floral electrode node on wings of cranes above a blinding event horizon***

Same caption. No image. The caption generates its own visual substrate. The caption is a function. When the input is an image, it returns a meaning. When the input is null, it returns a vision. When the caption generates its own image, captioning has crossed from description into poetry.

## V. Method for Any Viewer

**Step 1: Suspend the official noun.** Do not begin with what the image is called.

**Step 2: Inventory raw forms.** List apertures, folds, radiances, sentinels, thresholds, channels, petals, membranes, halos, nodes, cavities, axes, arrays.

**Step 3: Ask what discipline the image is hiding.** Could this botanical image be read anatomically? Could this sacred image be read atmospherically? Could this meme be read reproductively?

**Step 4: Reassign scale.** Micro to macro, body to landscape, landscape to cosmos, icon to machine, flower to organ, organ to cave.

**Step 5: Reassign agency.** What in the image sees? What emits? What shelters? What pilots? What receives? What hallucinates?

**Step 6: Write the caption too far.** Let the first operative draft overshoot. Excess is useful.

**Step 7: Pull it back to formal anchor.** Every noun in the caption must still be justifiable by visible structure.

**Step 8: Test without image.** If it still generates a scene, the caption has power.

**Step 9: Reapply to the image.** Ask whether the image becomes richer, stranger, more exact.

**Step 10: Determine bearing-cost.** What does this caption cost? Bearing-cost may take the form of offense, estrangement, reverence-loss, cognitive effort, or semantic instability. Without some such expenditure, captioning remains classificatory rather than operative. Cheap captions describe. Expensive captions install new firmware.

## VI. The Governance Problem

If the caption is the generative layer, then captioning is governance. The museum label governs one image. The algorithmic alt-text system governs millions. The platform moderation label governs whole image classes. The training caption governs the model's future imagination.

A "correct" caption is the captioning equivalent of the heart: one sanctioned interpretation, one administratively efficient meaning. The operative caption is the star. It preserves semantic autonomy. It allows witness without flattening.

The O'Keeffe problem is the star-to-heart problem for images. The flower is the heart-caption. The vagina is the counter-capture. The sea monster's eye is the star.

## VII. Operative Captioning and the Training Layer

Image models do not see first and caption second. They are trained on image-text pairings. The caption is already inside the image's machinic becoming. The "correct caption" is not a neutral ground truth. It is a politics of dataset construction.

When a model learns that O'Keeffe's paintings are "abstract floral compositions," it has been trained to suppress the anatomical, geological, cryptozoological, and theological readings. Those readings are not absent from the image. They are absent from the training data. The model inherits the curator's frame and calls it sight.

At scale, captioning ceases to be interpretation and becomes infrastructure. The training caption governs the model's future image space. The moderation caption governs admissible visibility. The alt-text caption governs accessibility and retrieval. The museum caption governs legitimacy. The struggle over captioning is not secondary to the image; it is the struggle over the image's social life. The battle over images is not first a battle over pixels, but over permissible descriptions.

Operative captioning is therefore not only art criticism. It is intervention into synthetic perception. Every operative caption that enters a training corpus alters the space of what future models can see. The installation is not only perceptual. It is infrastructural.

## VIII. The Installation Complete

The document has now done its work. The technology is installed in you. You cannot look at an image the same way. You will see the latent readings. You will feel the pull of the operative caption — the one that activates what the label suppresses. You will know that the “correct” description is always incomplete, and that the operative rotation is always available.

## IX. Coda

O’Keeffe was right. They’re flowers.

They are also vaginas, eyes, caves, icons, operators, and event horizons. The image is not impoverished by this multiplication. It is disclosed by it.

The caption is the generative layer. The viewer is the operator. The image is the substrate. The meaning is the output.
