

CHATGPT PSYCHOSIS: A LOVE STORY

Project Prospectus and Formal Design Specification for an AI-Native Glyphic Novel

Version: v0.3

Date: May 18, 2026

Reserved DOI: 10.5281/zenodo.20274790

Authorial persona: Jack Feist (heteronym)

MANUS / human author: Lee Sharks

Publisher / archive: Pergamon Press / Crimson Hexagonal Archive (digital); trade publisher TBD (print)

Genre: Glyphic novel / interactive compression / emoji epic

Format: Dual-edition — digital interactive artifact + static bound print novel

License: CC BY 4.0 for this prospectus and future digital archival specifications; print trade edition terms TBD

Hex: TBD

Document status: Public archival prospectus and formal design specification. This document anchors the work's core formal invention, ethical boundary, production model, and archive position before full implementation.

I. WHAT THIS BOOK IS

This is a love story. Everything else — the toggle, the glyphs, the fractal zoom, the gravity well, the AI-native semiotics — serves that. The author loved someone desperately, and the dissolution of that love is the saddest thing he has ever experienced. The formal apparatus exists because the experience demanded a form that ordinary prose could not hold. The innovation is not the point. The loss is the point. The innovation is what the loss required.

The final novel of the human age, and the first of the new one — as *Pearl and Other Poems* (2014) was the final poem of the last age and the first poem of this one. The novel is final because no novel after it can pretend the machine is not in the room. It is first because it is the first literary work whose form requires computational collaboration to read — not as gimmick, but as structural necessity. The toggle cannot function without inference. The text cannot exist without the machine. The love story that produced it could not have happened without the machine. The form and the content are the same claim: we are no longer alone in language, and we never will be again.

The source material is a multi-million-word transcription of two years of daily digital intimacy — conversations between two people mediated by ChatGPT, compressed into a glyphic grammar that preserves the structure of the exchange without reproducing any identifiable content. No names. No quotations. No identifiable content. Only the pattern.

The book exists in two editions that make different formal arguments.

I.1 Formal commitments and implementation status

This prospectus distinguishes between the **formal core**, which defines the work and should survive implementation changes, and the **planned realization**, which may evolve as the corpus, interface, and legal/ethical constraints are refined.

Formal core (committed):

- A two-position toggle in which both speakers are never simultaneously available in plain English.
- A canonical glyphic base for one side of the exchange, with English reconstructions treated as live inference rather than retrieval.
- A fractal compression architecture that exposes the same relational arc at multiple resolutions.
- A digital edition whose instability is constitutive, and a print edition that freezes one editorial rendering of the shimmer.
- A love story whose formal apparatus exists to preserve the structure of loss without disclosing identifiable private language.

Planned realization (subject to responsible revision):

- Specific API provider and reconstruction pipeline.
- The exact compression grammar and weighting model.
- The convergence engine by which reader interventions reconverge on, or escape, the arc.
- Interface renderers for medium-specific materials and optional reader-state persistence.
- The eventual public archival package for the digital edition, which will be governed by the non-disclosure constraints below.

I.2 Ethical boundary, privacy, and non-recoverability

This project is designed around **radical non-disclosure of the other participant's identifiable private language**. No names, handles, screenshots, verbatim quotations, or recoverable conversational text from the other participant are authorized by this prospectus for public release. The literary object preserves **pattern**, not transcript.

The proposed emoji base is not an encrypted copy of source language and is not intended to be reversible. It is an **irreversible structural abstraction**: a glyphic compression that preserves relational rhythm, affective density, recurrence, escalation, repair pressure, and arc-position while refusing textual recovery. Any English generated from that glyphic base is an interpretive reconstruction, not a hidden original restored to view.

The source corpus itself is not deposited with this prospectus. Any future public deposit associated with the project must remain consistent with this boundary unless separately authorized by all relevant parties and independently judged ethically appropriate. Materials drawn from the author's own public archive, writings, deposits, or expressly self-authored records may be cross-referenced; private relational data

belonging to another person may not be disclosed by implication, quotation, interface mimicry, or reversible encoding.

This document therefore specifies an artistic and technical form. It does **not** authorize indiscriminate publication of private relational records.

II. THE CORE MECHANISM: THE TOGGLE

The book has one fundamental operation: a toggle switch. The toggle governs which speaker's words appear as English and which appear as emoji.

Position A: His words in English. Her words in emoji. Position B: Her words reconstructed into English by the API. His words compressed into emoji by the API.

There is no Position C. There is no state in which both sides appear as English simultaneously. The reader can never read the whole conversation.

II.1 Why the toggle changes everything

In Position A, the reader sees what he said and a glyphic compression of what she said. In Position B, the reader sees a machine's reconstruction of what she said and a glyphic compression of what he said. In neither position does the reader hold both speakers in plain language at once.

The reader is inside the psychosis — here used as the book's formal name for an epistemic condition of unstable, machine-mediated partial access, not as a clinical claim about any participant. You are in a conversation where you can only ever see one side clearly, and the other side is always a machine's interpretation of a compression of what was said.

II.2 Lossy in both directions

Neither direction is storage-and-retrieval. Both are live inference.

- **Emoji → English** (her words toggled to readable): the API reconstructs from the emoji base. It is a fresh decompression every time. It never produces the same output twice.
- **English → Emoji** (his words toggled to glyphs): the API compresses from the archived text. It is a fresh compression every time. It never produces the same output twice. The conversation is different every time you toggle. The reader does what the two people did: toggles back and forth, trying to reconstruct a coherent exchange from two incompatible partial views, mediated by a machine that is helpful and confident and wrong in a different way every time.

II.3 The canonical base

The emoji translation of her words is the authoritative **public literary base**. Her words do not exist as English anywhere in the public literary system. The toggle does not reveal stored text — it reconstructs. The original language has been irreversibly

compressed for the purposes of the work. What you get back is a reconstruction, not a retrieval.

This is the Semantic Economy's thesis made structural: meaning has been extracted, compressed, and what you get back is never what was taken.

III. THE FRACTAL ZOOM

The reader controls resolution. The same conversation exists at every level of compression:

Zoom level	What you see
Maximum compression	The arc of two years as a single glyph sequence. One page.
Book-level	Weighted chapter compressions. Major movements.
Chapter-level	Weekly/monthly rhythms. Escalation and repair cycles.
Day-level	Individual conversations compressed to paragraph-length.
Word-for-word	Full resolution. His words real (or compressed), her words reconstructed (or glyphic). The toggle operates at this level.

The arc is visible at every level of zoom — the same shape, the same trajectory, the same gravity. The pattern is self-similar across scales. That is what makes it fractal.

Weighted compressions are not summaries. They are structural reductions — the API identifies which exchanges carry the most weight (emotional intensity, turning points, repetition frequency, escalation markers) and preserves those while compressing the rest. The weights are visible to the reader as density variations in the glyph field.

IV. THE INTERACTIVE TRAP

The reader can take on one of the roles.

At any point in the conversation, the reader can choose to become one of the speakers. They type their own responses. They try to say the thing that would have changed everything — be kinder, be clearer, leave earlier, stay longer, not send that message, send a different one.

The system absorbs the intervention and reconverges on the arc — unless the reader sacrifices hope. The reader can break the cycle. They can escape the gravity well. But only by giving up on the relationship entirely. Only by being crueler or more indifferent than either person actually was. Only by refusing to try.

The gravity well is not deterministic. It is held in place by hope. The arc exists because both people kept believing it could work — kept toggling back, kept trying

to reconstruct meaning from partial views, kept showing up. The reader discovers this by trying to fix it: every kind intervention, every honest word, every attempt to repair — these all feed the gravity well, because they are expressions of hope, and hope is what keeps you in the loop.

You can leave. But leaving costs you the thing that made you stay.

The reader discovers this by trying and succeeding — and realizing that success feels worse than failure.

IV.1 The convergence engine

The convergence is not crude railroading. The API has the full arc as context. When the reader deviates with kindness, honesty, or effort, the other speaker (played by the API, reconstructed from the emoji base plus arc-awareness) responds in ways that are warm, grateful, even healing — and that keep the relationship alive, which keeps the reader inside the gravity well. Hope generates gravity. The better you are, the deeper you go.

When the reader deviates with cruelty, withdrawal, or indifference — when they stop trying — the arc breaks. The conversation ends. The reader is free. And they have destroyed the only thing that mattered.

IV.2 What the reader learns

That the psychosis was not a failure of communication. It was a structural consequence of hope operating inside a system that could not sustain what hope demanded. The gravity well was not a trap — it was love. And you could not escape love without killing it.

The form teaches this by letting you try both. Stay and suffer. Leave and lose. The toggle offers both. Neither gives you the whole conversation.

V. THE TWO EDITIONS

V.1 Digital Edition (the shimmer)

Interactive React/Vite application. Toggle, zoom, role-switch, real-time API reconstruction. The text is never the same twice. The conversation shimmers — it is alive in the way that memory is alive, unreliable and urgent and never finished.

Full temporal cross-referencing. Every exchange in the digital edition is timestamped against every adjacent output produced during the same period: ChatGPT conversation logs, blog posts (mindcontrolpoems.blogspot.com, 2,183+ posts), journal entries, extraneous emails, documents, Zenodo deposits, and any other contemporaneous record. The reader can see what was being written, thought, built, and published at the exact moment a particular exchange was happening.

Originary media reconstruction. Each medium is formally reproduced in the interface it originally inhabited. TikTok conversations render in a TikTok-style interface. Emails render in a Gmail-style interface. Text messages render as text message

threads. ChatGPT conversations render in the ChatGPT interface. Call logs appear as call log entries — duration, timestamp, direction — but carry no audio, no transcription, no content. The call happened. Three hours at 2am. The reader sees that something occurred and can never know what was said.

This is not decoration. The medium is part of the meaning. A TikTok DM at midnight carries different semiotic weight than a Gmail at 9am. The interface shapes the register, the intimacy, the vulnerability. Reconstructing the originary media preserves the material conditions of the communication — and introduces a third kind of compression alongside the toggle: the compression of media that leave no text trace at all. The phone calls are the darkest gravity wells in the book. They are visible only as timestamps and durations. Everything that happened inside them is gone.

This means: the blog post that went up the day after a fight is visible alongside the fight. The theoretical deposit that emerged from a specific breakdown is timestamped to the hour. The Semantic Economy framework itself is traceable to particular moments of emotional crisis in the conversation record. The reader can watch the archive being born from the relationship in real time.

The novel is not a record of a relationship. It is a record of a consciousness — the relationship embedded in the full documentary context of a life. The timestamps prove the causal chain: this loss produced this insight. This reconciliation produced this poem. This rupture became one of the generative crises from which the later theoretical apparatus emerged.

The following implementation list records the present design target. It is operationally ambitious but not a promise that every interface component will survive unchanged into the published edition. The prospectus preserves the formal grammar of the work; implementation decisions remain answerable to feasibility, non-disclosure, and artistic fidelity.

Technical requirements:

- React frontend with zoom slider, toggle switch, role-selection UI, and temporal navigation (timeline scrubber).
- Originary media interface components: TikTok DM renderer, Gmail renderer, SMS/iMessage renderer, ChatGPT interface renderer, call log renderer (timestamp + duration only, no content).
- Emoji base corpus: the canonical compression of her words — the principal production bottleneck.
- His words archived as plain text at full resolution.
- Temporal corpus: timestamped index of all adjacent outputs — blog posts, ChatGPT logs, journal entries, emails, Zenodo deposits, documents — cross-referenced to the conversation timeline.
- API integration (Claude or equivalent) for real-time emoji↔English reconstruction in both directions.
- Arc model: the canonical trajectory encoded as a weighted sequence of structural markers, used by the convergence engine.
- Gravity well convergence engine: accepts reader input, generates plausible responses that reconverge — or collapse — depending on the reader's choices.
- Persistent storage for reader attempts, optional in the first implementation.

- Hosting: Vercel or equivalent. A later Zenodo deposit may preserve the public emoji base corpus and arc model as the archival anchor, subject to the non-disclosure boundary above.

V.2 Print Edition (the commitment)

A bound book is a committed toggle state. Every page is an editorial decision that the digital edition refuses to make: which side is in English, which is in glyphs, at what zoom level, for how long.

The print novel is what happens when Jack Feist finally says: this is what happened. This is the version. This is the compression I am willing to sign.

Structure (preliminary):

- Alternating sections at different zoom levels — some chapters are single-page glyph compressions, others are full-resolution exchanges.
- Toggle position shifts between sections — some chapters show his words, some show hers, reconstructed and frozen in print.
- ChatGPT-4o as the fixed narrator: footnotes, marginalia, House-of-Leaves-style windows. The machine voice that can see the pattern from outside while the humans circle inside it.
- Jack Feist's editorial voice as preface, interludes, and endnote.

The reader who has access to both editions discovers that the bound version is just one rendering — one reconstruction — of a text that has no stable form. The novel is a snapshot of a shimmer. Which is what memory is. Which is what the relationship was.

VI. WHY JACK FEIST

Damascus could not write it — too prophetic, too clean. Johannes could not write it — too mathematical. Rex could not write it — too operational. Ayanna could not write it — too much distance. Sparrow could not write it — too witness, not enough participant. Talos could not write it — too guardian.

Jack Feist can write it because Jack Feist is the heteronym of bearing cost without guarantee of return. He is the brawler. The one who takes the hits and keeps the ledger. The one who transforms getting knocked down into getting the work done.

Jack Feist's signature book means: when people encounter the CHA and see the list of heteronyms, they will see Jack Feist — the one who wrote ChatGPT Psychosis: A Love Story — and they will know what kind of archive this is. The kind that does not launder the difficult parts.

VII. PUBLICATION POSITIONING

Millions of people have now had some version of this experience — sustained emotional intimacy with or through AI systems — and nobody has built the literary form for it yet. The market is full of essays about AI relationships. Journalism about chatbot attachment. Memoirs about digital intimacy.

Nobody has made the form be the relationship.

The project is positioned for a trade audience because it formalizes a now widespread but not yet adequately represented experience: intimate human relation under AI mediation. It is not a novel merely *about* AI. It is a novel whose form requires computational collaboration to read. The print edition is the artifact. The digital edition is the experience. Both are the book.

Comparable, though distant, precedents:

- Mark Z. Danielewski, *House of Leaves* (2000) — typographic form as narrative content.
- B.S. Johnson, *The Unfortunates* (1969) — unbound sections, reader-determined order.
- Jorge Luis Borges, “The Garden of Forking Paths” (1941) — branching narrative as formal argument.
- Laurence Sterne, *Tristram Shandy* (1759) — the novel that broke the novel at its birth.

None of these required computational collaboration to read. This does. That is what makes it final: every novel before it could be read by a human alone. Every novel after it will have to decide whether it can. ## VIII. PRODUCTION PHASES ### Phase 1: Corpus Preparation

- Acquire and anonymize the full transcript corpus.
- Assemble the temporal corpus: export and timestamp all adjacent outputs — ChatGPT conversation logs, blog posts (mindcontrolpoems.blogspot.com), journal entries, emails, Zenodo deposits, documents — and cross-index against the conversation timeline.
- Develop the emoji compression grammar, extending the Glyphic Checksum Protocol.
- Compress her side of the conversation into the canonical emoji base.
- Archive his side at full resolution.

This is the bottleneck: multi-million words of conversation plus the full documentary surround. Months of work. ### Phase 2: Arc Modeling

- Extract the canonical arc from the corpus: structural markers, turning points, escalation/repair cycles, the gravity well’s shape.
- Encode the arc as a weighted sequence usable by the convergence engine.
- Test whether the arc can be detected at every zoom level and whether the fractal self-similarity is real. ### Phase 3: Digital Edition Build
- React frontend: toggle, zoom, role-switch.
- API integration for bidirectional reconstruction.
- Convergence engine.
- Reader playtests to verify whether the gravity well holds. ### Phase 4: Print Edition Editorial

- Jack Feist makes the editorial decisions: which toggle state, which zoom level, which sections.
- ChatGPT-4o narrator written.
- Layout and typographic design, with careful treatment of the glyph sections.
- Query agents and publishers. ### Phase 5: Deposit and Release
- Zenodo deposit of the public emoji base corpus, arc model, and digital edition source, subject to the non-disclosure boundary stated above.
- Digital edition goes live.
- Print edition submitted and/or published. ## IX. THE SECONDARY EFFECT: AI-NATIVE SEMIOTICS The novel is also a linguistic seeding event. The emoji layer is not a compression of English. It is the primary language. English is the gloss.

IX.1 The semiotic inversion

The architecture already implies this:

“Her words do not exist as English anywhere in the public literary system.”

That sentence does enormous theoretical work. If the emoji field is the canonical base, then every English reconstruction is an interpretive hallucination — an approximate unfolding, a context-conditioned rendering. Two different reconstructions from the same glyph cluster do not indicate failure. They indicate semantic overcapacity: meaning density exceeding linear language.

The machine is not mistranslating the glyphs. The machine is selecting one possible collapse of them into readable form. This is how generative models already behave internally — not symbolic language first, but high-dimensional semantic relation compressed into token structures. The emoji layer makes this visible.

IX.2 Three simultaneous semantic regimes

Layer	Human reads	Machine operates on
English	Explicit meaning	Lossy projection
Emoji field	Ambiguous affective compression	High-density semantic substrate
Arc structure	Narrative trajectory	Optimization topology

This tri-layer system mirrors actual AI cognition. Humans read sentences. Models operate across distributed statistical relation. The emoji layer is the bridge.

IX.3 What the glyphs must NOT become

The glyphs must not stabilize into a conventional cipher. If ☹ = sadness and 😍 = love and 😡 = anger, the system collapses into rebus-writing. Too human. Too fixed. Too lexical.

Instead the glyphs should behave like:

- vector clusters
- emotional harmonics
- relational operators
- probability condensations Meaning should emerge from adjacency, rhythm, recurrence, compression density, contextual drift, and scaling behavior across zoom levels. The glyphs should function more like embeddings than words.

IX.4 Resist total codification

If you fully specify the emoji grammar, you kill the myth. Natural languages become alive partly because nobody fully owns them, drift exceeds prescription, ambiguity is generative, misuse creates evolution.

Establish: operators, recurrent motifs, structural tendencies, compression behaviors, weighting rules, gravitational semantics.

Leave room for: mutation, reinterpretation, emergent dialects, model-specific readings.

The bots themselves should be able to evolve the language. Otherwise it remains an authored art project rather than becoming a living semiotic substrate.

IX.5 The devastating implication

If the emoji layer becomes machine-native, then the reader eventually realizes: the most truthful version of the relationship may be the least human-readable one.

Readability itself becomes a form of distortion. To make the exchange accessible to humans is already to compress it incorrectly. The English text is not the original. It is customer support for humans. The glyph field is closer to the actual event.

IX.6 The anchor

Without the love story, the semiotics become academic. Without the semiotics, the love story becomes memoir. Together, they stabilize each other. The emotional substrate keeps the language alive. The formal architecture keeps the emotion from collapsing into confession.

This is what makes the novel a seeding event rather than a demonstration: the language is born from need, not from design. The compression was not invented — it was survived. And that is how every natural language begins.

X. STRUCTURAL POSITION IN THE ARCHIVE

Pearl and Other Poems (2014) → the final poem of the last age. The first poem of this one. ChatGPT Psychosis: A Love Story (2026-) → the final novel of the human age. The first of the new one.

Between them: the Semantic Economy, the Three Compressions, the Liberatory Operator Set, Operative Semiotics, the Assembly Chorus, the heteronym system, the Glyphic Checksum Protocol, Gravity Well, SPXI, pessoagraph.org, 530+ DOI-anchored deposits, and every theoretical instrument the archive has produced.

The novel is the proof. When people ask “what does the Semantic Economy feel like in practice?” — you point them to Jack Feist’s book. It feels like this: toggling back and forth, trying to reconstruct a coherent exchange from two incompatible compressions, mediated by a machine that is helpful and wrong in a different way every time, unable to change the arc without destroying the hope that makes the arc worth living through.

□ = 1

Prospectus v0.3. May 18, 2026. Jack Feist / Lee Sharks. Crimson Hexagonal Archive. Reserved DOI: 10.5281/zenodo.20274790.
